General Description

The S6R1016(V/C/W)1A and S6R1008(V/C/W)1A is a 1,048,576-bit high-speed Static Random Access Memory organized as 64K(128k) words by 16(8) bits. The S6R1016(V/C/W)1A and S6R1008(V/C/W)1A use 16(8) common input and output lines and have an output enable pin which operates faster than address access time at read cycle. And S6R1016(V/C/W)1A allows that lower and upper byte access by data byte control($\overline{UB}$, $\overline{LB}$). The device is fabricated using advanced CMOS process,6-TR based cell technology and designed for high-speed circuit technology. It is particularly well suited for use in high-density high-speed system applications. The S6R1016(V/C/W)1A is packaged in industry standard 400mil 44-pin TSOP2 and 48FBGA.

The S6R1008(V/C/W)1A is packaged in industry standard 32sTSOP1 and 48FBGA.

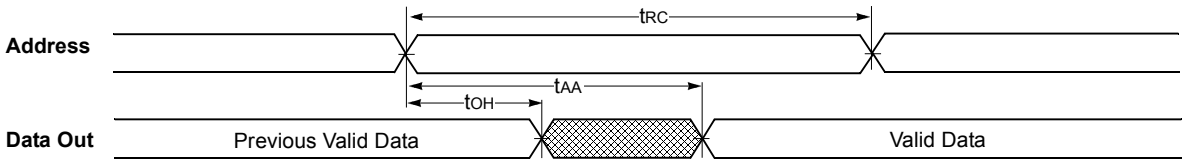
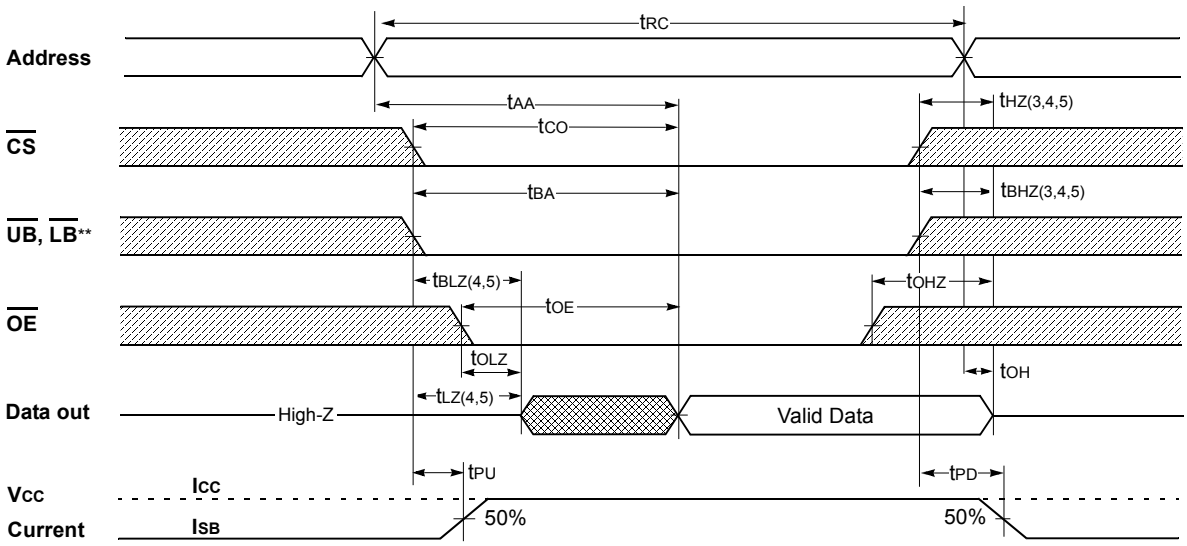
Timing Diagrams

Timing Waveform Of Read Cycle(1) (Address Controlled, $\overline{CS}$=$\overline{OE}$=V_{IL}, $\overline{WE}$=V_{IH}, $\overline{UB}$, $\overline{LB}$=V_{IL} **)



** Those parameters are applied for x16 mode only.

Timing Waveform Of Read Cycle(2) ($\overline{WE}$=V_{IH})

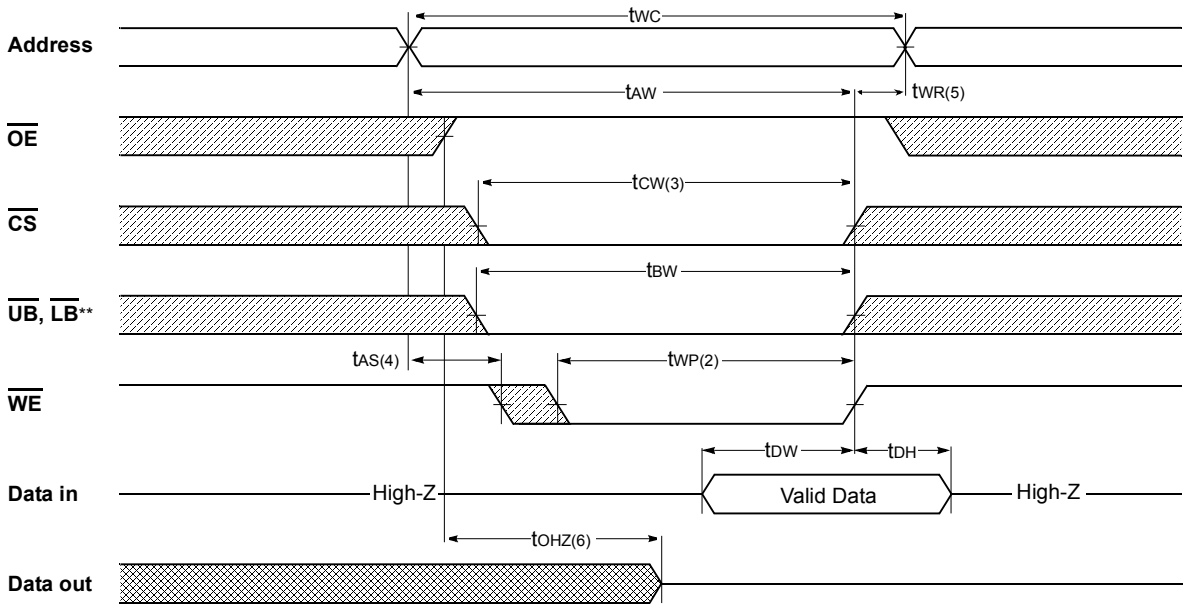


NOTES(Read Cycle)

1. $\overline{WE}$ is high for read cycle.
2. All read cycle timing is referenced from the last valid address to the first transition address.
3. t_{HZ} and t_{OHZ} are defined as the time at which the outputs achieve the open circuit condition and are not referenced to V_{OH} or V_{OL} levels.
4. At any given temperature and voltage condition, t_{HZ}(Max.) is less than t_{LZ}(Min.) both for a given device and from device to device.
5. Transition is measured ±200mV from steady state voltage with Load(B). This parameter is sampled and not 100% tested.
6. Device is continuously selected with $\overline{CS}$=V_{IL}.
7. Address valid prior to coincident with $\overline{CS}$ transition low.
8. For common I/O applications, minimization or elimination of bus contention conditions is necessary during read and write cycle.

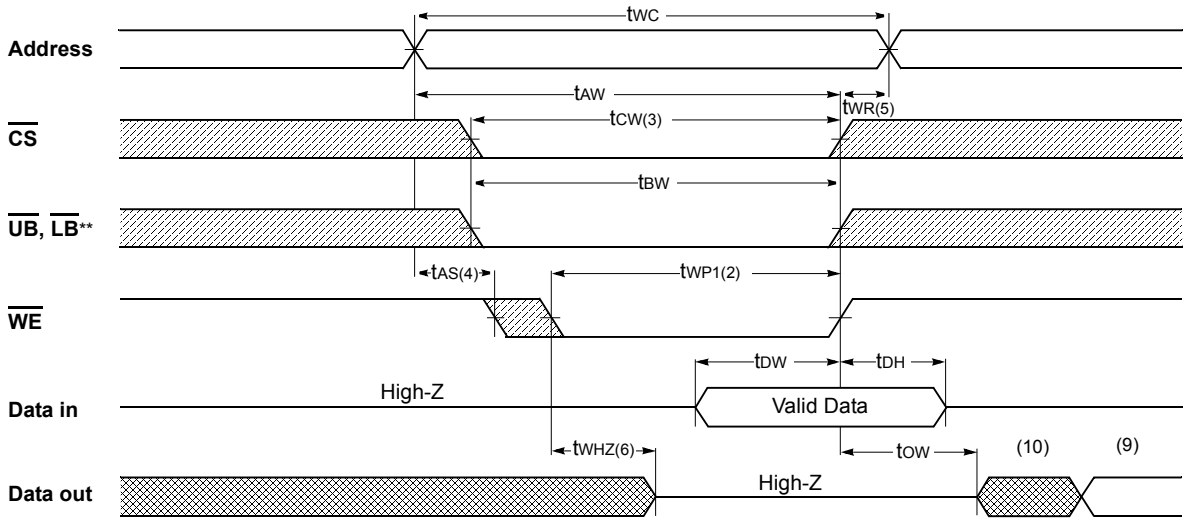
** Those parameters are applied for x16 mode only.

Timing Waveform Of Write Cycle(1) ($\overline{OE}$ Clock)



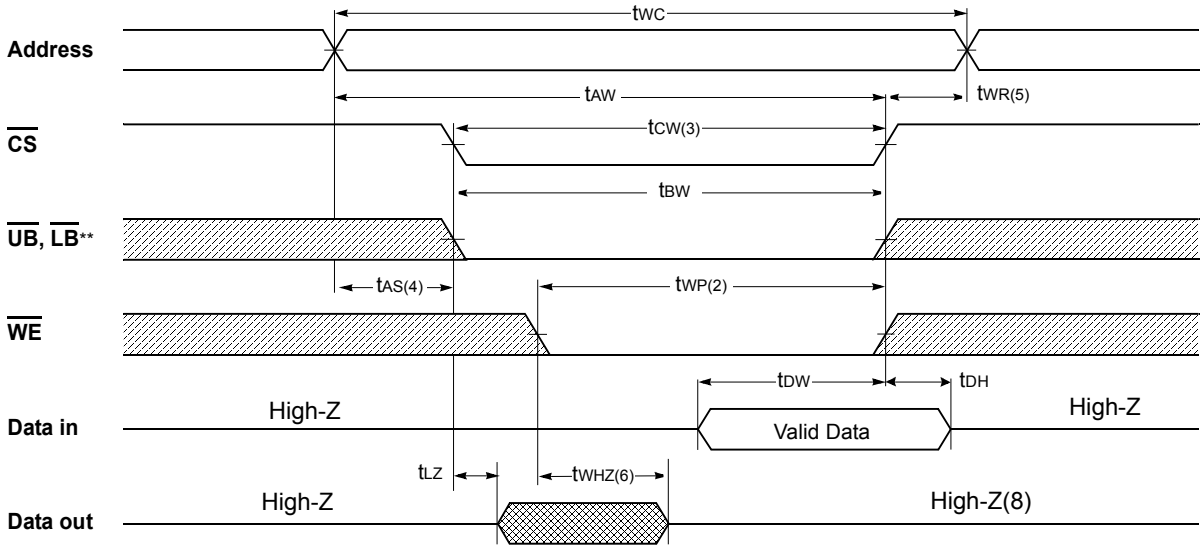
** Those parameters are applied for x16 mode only.

Timing Waveform Of Write Cycle(2) ($\overline{OE}$=Low fixed)



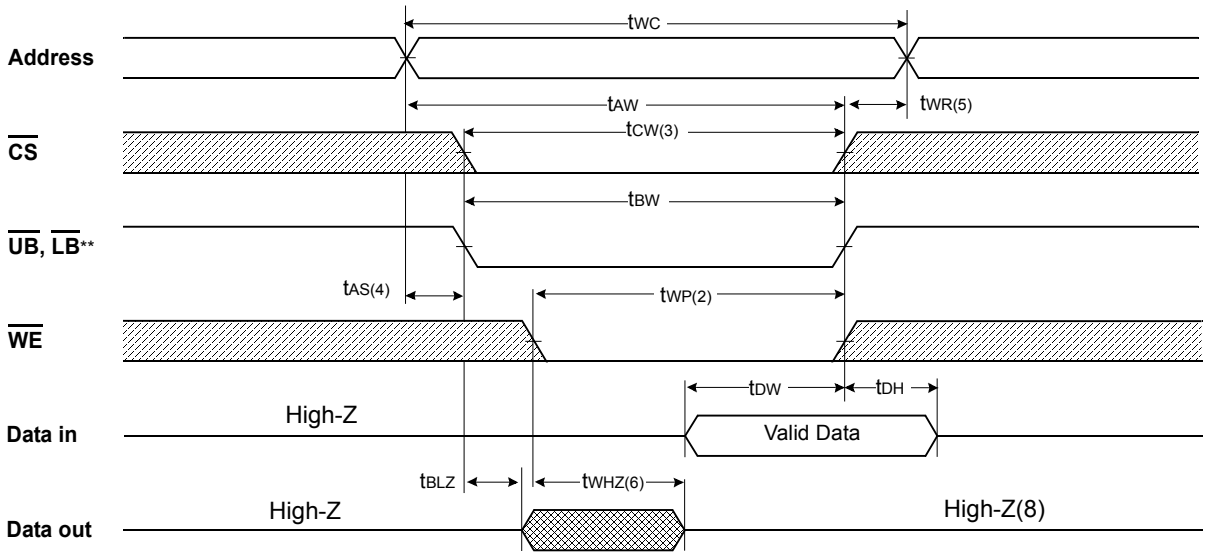
** Those parameters are applied for x16 mode only.

Timing Waveform Of Write Cycle(3) ($\overline{CS}$=Controlled)



** Those parameters are applied for x16 mode only.

Timing Waveform Of Write Cycle(4) ($\overline{UB}$, $\overline{LB}$ Controlled)



NOTES(Write Cycle)

1. All write cycle timing is referenced from the last valid address to the first transition address.
2. A write occurs during the overlap of a low $\overline{CS}$,$\overline{WE}$,$\overline{LB}$ and $\overline{UB}$. A write begins at the latest transition $\overline{CS}$ going low and $\overline{WE}$ going low ; A write ends at the earliest transition $\overline{CS}$ going high or $\overline{WE}$ going high. t_{WP} is measured from the beginning of write to the end of write.
3. t_{CW} is measured from the later of $\overline{CS}$ going low to end of write.
4. t_{AS} is measured from the address valid to the beginning of write.
5. t_{WR} is measured from the end of write to the address change. t_{WR} applied in case a write ends as $\overline{CS}$ or $\overline{WE}$ going high.
6. If $\overline{OE}$, $\overline{CS}$ and $\overline{WE}$ are in the Read Mode during this period, the I/O pins are in the output low-Z state. Inputs of opposite phase of the output must not . be applied because bus contention can occur.
7. For common I/O applications, minimization or elimination of bus contention conditions is necessary during read and write cycle.
8. If $\overline{CS}$ goes low simultaneously with $\overline{WE}$ going or after $\overline{WE}$ going low, the outputs remain high impedance state.
9. Dout is the read data of the new address.
10. When $\overline{CS}$ is low : I/O pins are in the output state. The input signals in the opposite phase leading to the output should not be applied.

** Those parameters are applied for x16 mode only.
